3.1 Blink_SDK Class Reference

Public Member Functions

- [Blink_SDK](#) (unsigned int SLM_bit_depth, unsigned int SLM_resolution, unsigned int *n_boards_found, bool *constructed_ok, bool is_nematic_type=true, bool RAM_write_enable=true, bool use_GPU_if_available=true, size_t max_transient_frames=20U, const char *static_regional_lut_file=0)
Constructor for the Blink SDK.
- [~Blink_SDK](#) ()
Destructor for the Blink SDK.
- bool [Is_overdrive_available](#) () const
Returns true if overdrive functionality is built into this version of the SDK, otherwise false.
- bool [Is_slm_transient_constructed](#) () const
Returns the state of the overdrive wrapper class responsible for transient frame calculations.
- bool [Write_overdrive_image](#) (int board, const unsigned char *target_phase, bool wait_for_trigger=false, bool external_pulse=false)
Writes an image to the SLM using the intermediate transient frames calculated with overdrive.
- bool [Calculate_transient_frames](#) (const unsigned char *target_phase, unsigned int *byte_count)
Calculates the series of frames to be sent to the SLM to transition to target_phase using overdrive.
- bool [Retrieve_transient_frames](#) (unsigned char *frame_buffer)
Retrieves the data for a previously-calculated series of frames. Typically a call to this function is preceded by a call to Calculate_transient_frames.
- bool [Write_transient_frames](#) (int board, const unsigned char *frame_buffer, unsigned int max_display_frames=0↵U, bool wait_for_trigger=false, bool external_pulse=false)
Writes the sequence of frames in frame_buffer to the SLM.
- bool [Read_transient_buffer_size](#) (const char *filename, unsigned int *byte_count)
Reads the file header and retrieves the number of bytes to be allocated for reading the frame.
- bool [Read_transient_buffer](#) (const char *filename, unsigned int byte_count, unsigned char *frame_buffer)
Reads the series of transient frames from the file into frame_buffer, which must point to sufficient memory to hold the entire buffer.
- bool [Save_transient_frames](#) (const char *filename, const unsigned char *frame_buffer)
Writes transient frame data to a file.
- const char * [Get_last_error_message](#) () const

Returns a pointer to the string corresponding to the last error condition detected. If no error has been detected, the string is "Blink SDK: No error".

- bool [Load_overdrive_LUT_file](#) (const char *static_regional_lut_file)
Loads a new set of LUT data for transient calculations.
- bool [Load_linear_LUT](#) (int board)
Forces a linear LUT to be loaded to the SLM.
- size_t [Get_bits_per_pixel](#) () const
Returns the number of bits for each pixel on the SLM (typically 8 or 16).
- const char * [Get_version_info](#) () const
Returns a pointer to the string with version information for this SDK.
- bool [SLM_power](#) (int board, bool power_state)
Turns the SLM on or off for *board*.
- void [SLM_power](#) (bool power_state)
Turns all SLMs on or off.
- bool [Write_image](#) (int board, const unsigned char *image, unsigned int image_size, bool wait_for_trigger=false, bool external_pulse=false)
Write a non-overdrive image to the SLM controlled by *board*.
- bool [Load_LUT_file](#) (int board, const char *LUT_file)
Loads the specified LUT file to the SLM.
- int [Compute_TF](#) (float frame_rate)
- void [Set_true_frames](#) (int true_frames)
- bool [Set_coverglass_flipping](#) (int board, bool flipping)
- bool [Set_correction_type](#) (int board, bool WFC)
- bool [Write_cal_buffer](#) (int board, const unsigned char *buffer)
- bool [Select_cal_frame](#) (int board, int frame)

3.1.1 Constructor & Destructor Documentation

- 3.1.1.1 **Blink_SDK::Blink_SDK** (unsigned int *SLM_bit_depth*, unsigned int *SLM_resolution*, unsigned int * *n_boards_found*, bool * *constructed_ok*, bool *is_nematic_type* = true, bool *RAM_write_enable* = true, bool *use_GPU_if_available* = true, size_t *max_transient_frames* = 20U, const char * *static_regional_lut_file* = 0)

Constructor for the Blink SDK.

Parameters

<i>SLM_bit_depth</i>	Options are currently 8 or 16
<i>SLM_resolution</i>	Options are currently 256 or 512 (square SLM assumed).
<i>n_boards_found</i>	Initial value ignored; set to the number of SLM boards found that have the requested resolution.
<i>constructed_ok</i>	true if all elements of the SDK were properly constructed, else false.
<i>is_nematic_type</i>	true for a nematic SLM (usual case); false for FLC.
<i>RAM_write_enable</i>	true for writing to RAM (usual case) false for slower writes.
<i>use_GPU_if_available</i>	true to use a GPU; false to use a CPU for Overdrive calculations. If true is provided, but no GPU is available, then a CPU will be used.

<i>max_transient_↔ frames</i>	The maximum number of transient frames calculated by the Overdrive Plus algorithm.
<i>static_regional_↔ lut_file</i>	Regional LUT file; used for Overdrive calculations.

3.1.1.2 Blink_SDK::~~Blink_SDK ()

Destructor for the Blink SDK.

3.1.2 Member Function Documentation

3.1.2.1 bool Blink_SDK::Calculate_transient_frames (const unsigned char * *target_phase*, unsigned int * *byte_count*)

Calculates the series of frames to be sent to the SLM to transition to *target_phase* using overdrive.

Parameters

<i>target_phase</i>	Image of the target phase for the SLM. Phase values from 0 to 1.0 correspond to pixel value 0 and 255.
<i>byte_count</i>	Set by this function to the number of bytes required to store the sequence of frames. This parameter must not be NULL. Initial value is ignored.

Returns

`true` if there were no errors, otherwise `false`.

See also

[Get_last_error_message](#).

3.1.2.2 int Blink_SDK::Compute_TF (float *frame_rate*)

Parameters

<i>frame_rate</i>	
-------------------	--

Returns

`true` if there were no errors, otherwise `false`.

3.1.2.3 size_t Blink_SDK::Get_bits_per_pixel () const

Returns the number of bits for each pixel on the SLM (typically 8 or 16).

Returns

Number of bits per pixel.

3.1.2.4 `const char * Blink_SDK::Get_last_error_message () const`

Returns a pointer to the string corresponding to the last error condition detected. If no error has been detected, the string is "Blink SDK: No error".

Returns

Null-terminated C string.

3.1.2.5 `const char * Blink_SDK::Get_version_info () const`

Returns a pointer to the string with version information for this SDK.

Returns

Null-terminated C string.

3.1.2.6 `bool Blink_SDK::Is_overdrive_available () const`

Returns `true` if overdrive functionality is built into this version of the SDK, otherwise `false`.

3.1.2.7 `bool Blink_SDK::Is_slm_transient_constructed () const`

Returns the state of the overdrive wrapper class responsible for transient frame calculations.

Returns

`true` if there were no internal errors constructing the SLM_transient class, otherwise `false`.

See also

[Get_last_error_message](#).

3.1.2.8 `bool Blink_SDK::Load_linear_LUT (int board)`

Forces a linear LUT to be loaded to the SLM.

Parameters

<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).
--------------	---

Returns

`true` if there were no errors, otherwise `false`.

See also

[Get_last_error_message](#)

3.1.2.9 `bool Blink_SDK::Load_LUT_file (int board, const char * LUT_file)`

Loads the specified LUT file to the SLM.

Parameters

<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).
<i>LUT_file</i>	Fully-qualified path to LUT file.

Returns

`true` if there were no errors, otherwise `false`.

See also

[Get_last_error_message](#)

3.1.2.10 `bool Blink_SDK::Load_overdrive_LUT_file (const char * static_regional_lut_file)`

Loads a new set of LUT data for transient calculations.

Parameters

<i>static_regional_lut_file</i>	File with regional LUT data.
---------------------------------	------------------------------

Returns

`true` if there were no errors, otherwise `false`.

See also

[Get_last_error_message](#)

3.1.2.11 `bool Blink_SDK::Read_transient_buffer (const char * filename, unsigned int byte_count, unsigned char * frame_buffer)`

Reads the series of transient frames from the file into `frame_buffer`, which must point to sufficient memory to hold the entire buffer.

Call `ReadTransientBufferSize()` to determine the required buffer size. Pass the size of `FrameBuffer` in `ByteCount` (for error checking).

Parameters

<i>filename</i>	Name of the file containing transient data.
<i>byte_count</i>	Number of bytes that have been allocated in <code>frame_buffer</code> .
<i>frame_buffer</i>	Buffer to hold the frame data read from the file.

Returns

`true` if there were no errors, otherwise `false`.

See also

[Read_transient_buffer_size\(\)](#), [Get_last_error_message\(\)](#).

3.1.2.12 `bool Blink_SDK::Read_transient_buffer_size (const char * filename, unsigned int * byte_count)`

Reads the file header and retrieves the number of bytes to be allocated for reading the frame.

Call this function before calling `ReadTransientBuffer`, and allocate the appropriate buffer size for subsequent use by `ReadTransientBuffer()`.

Parameters

<i>filename</i>	Name of the file containing transient data.
<i>byte_count</i>	Set by this function to the number of bytes to be allocated. This parameter must not be NULL. Initial value is ignored.

Returns

`true` if there were no errors, otherwise `false`.

See also

`ReadTransientBuffer()`, [Get_last_error_message\(\)](#).

3.1.2.13 `bool Blink_SDK::Retrieve_transient_frames (unsigned char * frame_buffer)`

Retrieves the data for a previously-calculated series of frames. Typically a call to this function is preceded by a call to `Calculate_transient_frames`.

Parameters

<i>frame_buffer</i>	Pointer to a caller-provided memory area of sufficient size to store the frame data.
---------------------	--

Returns

`true` if there were no errors, otherwise `false`.

See also

`CalculateTransientFrames`, [Get_last_error_message](#).

3.1.2.14 `bool Blink_SDK::Save_transient_frames (const char * filename, const unsigned char * frame_buffer)`

Writes transient frame data to a file.

Parameters

<i>filename</i>	Name of the file to be written.
<i>frame_buffer</i>	Frame data to be written to the file.

Returns

`true` if there were no errors, otherwise `false`.

See also

[Get_last_error_message](#).

3.1.2.15 `bool Blink_SDK::Select_cal_frame (int board, int frame)`

Parameters

<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).
<i>frame</i>	

Returns

`true` if there were no errors, otherwise `false`.

3.1.2.16 `bool Blink_SDK::Set_correction_type (int board, bool WFC)`

Parameters

<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).
<i>WFC</i>	

Returns

`true` if there were no errors, otherwise `false`.

3.1.2.17 `bool Blink_SDK::Set_coverglass_flipping (int board, bool flipping)`

Parameters

<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).
<i>flipping</i>	

Returns

`true` if there were no errors, otherwise `false`.

3.1.2.18 `void Blink_SDK::Set_true_frames (int true_frames)`

Parameters

<i>true_frames</i>	
--------------------	--

Returns

3.1.2.19 `bool Blink_SDK::SLM_power (int board, bool power_state)`

Turns the SLM on or off for `board`.

Parameters

<i>power_state</i>	true for ON, false for OFF
<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).

Returns

true if there were no errors, otherwise false.

See also

[Get_last_error_message](#)

3.1.2.20 void Blink_SDK::SLM_power (bool *power_state*)

Turns all SLMs on or off.

Parameters

<i>power_state</i>	true for ON, false for OFF
--------------------	----------------------------

3.1.2.21 bool Blink_SDK::Write_cal_buffer (int *board*, const unsigned char * *buffer*)

Parameters

<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).
<i>buffer</i>	

Returns

true if there were no errors, otherwise false.

3.1.2.22 bool Blink_SDK::Write_image (int *board*, const unsigned char * *image*, unsigned int *image_size*, bool *wait_for_trigger* = false, bool *external_pulse* = false)

Write a non-overdrive image to the SLM controlled by *board*.

Parameters

<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).
<i>image</i>	The image to write to the SLM.
<i>image_size</i>	SLM width or height (a square SLM is assumed).
<i>wait_for_trigger</i>	If supported by hardware, this enables use of an external trigger to load images to the SLM.
<i>external_pulse</i>	Enables an external pulse when the image is written to the SLM.

Returns

true if the image was written successfully, otherwise false.

See also

[Get_last_error_message](#)

3.1.2.23 `bool Blink_SDK::Write_overdrive_image (int board, const unsigned char * target_phase, bool wait_for_trigger = false, bool external_pulse = false)`

Writes an image to the SLM using the intermediate transient frames calculated with overdrive.

Parameters

<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).
<i>target_phase</i>	Image of the target phase for the SLM.
<i>wait_for_trigger</i>	If supported by hardware, this enables use of an external trigger to load images to the SLM.
<i>external_pulse</i>	Enables an external pulse on the last transient frame.

Returns

`true` if there were no errors, otherwise `false`.

See also

[Get_last_error_message](#).

3.1.2.24 `bool Blink_SDK::Write_transient_frames (int board, const unsigned char * frame_buffer, unsigned int max_display_frames = 0U, bool wait_for_trigger = false, bool external_pulse = false)`

Writes the sequence of frames in `frame_buffer` to the SLM.

Parameters

<i>board</i>	Index of the board with the required SLM. The index is 1-based (not 0-based).
<i>frame_buffer</i>	Contains the sequence of frames to be written to the SLM.
<i>max_display_frames</i>	0 to display all frames in the sequence; non-zero to display no more than <code>max_display_frames</code> of the frames in <code>frame_buffer</code> .
<i>wait_for_trigger</i>	If supported by hardware, this enables use of an external trigger to load images to the SLM.
<i>external_pulse</i>	Enables an external pulse on the last transient frame.

Returns

`true` if there were no errors, otherwise `false`.

4.1.1 Detailed Description

Interface to the Blink SDK.

4.1.2 Using the Blink Overdrive SDK

4.1.2.1 General Overview

All but two overdrive functions return a `bool` value to indicate success or failure. When a function returns `false`, call `Get_last_error_message()` to get a text string with information about the failure. There are effectively three modes of operation using this SDK with overdrive.

4.1.2.2 Calculate and send frames to SLM

<<>>

4.1.2.3 Pre-calculate frames and store in memory before sending to SLM

<<>>

4.1.2.4 Load/save pre-calculated frames to files

<<>>
